

Web Scrapping

This Project is made just for Educational Purpose.

This Project is made using **Python Programming, Microsoft Excel** and **Microsoft PowerBI**.

In this Project I have used Python Programming Libraires such as **Selenium, BeautifulSoup, Time, Panda etc.** to scrap the data from the online Platforms like **Amazon and Flipkart**.

After scraping the data from websites, I stored the data on the Microsoft Excel and then cleaned it there only like removed Duplicates, removed null data, and at some points filled the Null Values using Mean methodology.

Once the data was cleaned it was uploaded onto **Microsoft PowerBI for visualization**.
